'Phlegmasia Coerulea Dolens. Report on 3 Cases'

Warsaw, Polaki Tygodnik Lekarski, Vol XVIII, No 6, 4 Feb
1963, pp 210-214.

Abstract: /Authors' English summary modified/ Phlegmasia
coerulea dolens is a seldom reported morbid state. Only
28 cases were reported until 1950 and only a few cases have
been presented since.

Three cases successfully treated by the authors are
reported. Pathogenesis, treatment and prognosis of this
rare morbid state are discussed. The pathogenic factors

KANABUSOWA I.

1366. KANABUSOWA I. ZI. Kliniki Chorób Dzieci U.W. O toksoplazmozie
Toxoplasmosis Polski Tygodnik Lekarski, Warsaw 1949, 4/8 (228-230)

A case is described in a boy of 3½. His mother, while pregnant, had spent some time in a district where a kind of epizootic was known to exist among cats. Seven months after his birth, the boy began to exhibit slight convulsive fits, which grew more intense as time went on. The fits recurred at about three-weekly intervals. Typical crescent-like calcifications in the brain tissue were detected radiologically. The complement-fixation tests with toxoplasma antigen proved positive in the boy, in a dilution of 1:16; they were positive in the mother, in a dilution of 1:4. The case is regarded as one of a prenatal infection; however, the possibility of both mother and boy having been infected by some common agent should not be entirely dismissed.

A. I., Mining Engineer, Kanafin, K. N., Chief Engineer

TITLE: Large-scale Ore Mining With the Aid of Hole Charges and
Short-delay Blasting

PERIODICAL: Gornyy zhurnal, 1960, No. 5, pp. 33 - 35

TEXT: The use of vehicles with individual drive in the mines of the Dzhezkazgan permitted large-scale mining of ores by means of hole charges at faces with and without benches. Experiments were conducted in mine No. 45 of the Dzhezkazganskoye rudoupravleniye (Dzhezkazgan Mine Administration) in order to determine the parameters for large-scale mining. The rock hardness was 12 to 14 according to Protod'yakonov. Three working programs for drilling and blasting were elaborated for mining at a face with benches. The scheme according to the third working program is shown in Fig. 3. Experiments showed that this scheme is most suitable for large-scale ore mining at a face with one bench. The holes were charged

with ammonite No. 6 and blasted by the short-delay method. Work at the faces is at present carried out with individually driven vehicles according to the third working program. As from June 1959, experimental work has been conducted at a face without benches. The best characteristic values in the technological and economic respect were obtained with the schemes shown in Figs. 2 and 3. Short-delay blasting was applied in all cases. Compared with fuse blasting, short-delay blasting gave much more favorable results. It is recommended to use at least 10 to 12 delay steps. There are 3 figures, 1 table, and 1 Soviet reference.

3052. OXIDATION TEST FOR MINERAL OILS. Zdersky, J. and Sank, L. (Chem. Obsor, 1949, vol. 24, 81-88; abstr. in chem. abstr., 1950, vol. 44, 4232-4233). Oxygen (250 \pm 10 m.l.) free of O₃ is bubbled through 30 g. of oil for 12 hours at 140 \pm 0.5°. The heating bath consists of a cylindrical paraf in bath. inserted into another oil bath equipped with a stirrer and automatic heat control. To determine the residue (sludge) to oxidize oil is treated first with CHCl₃ and later with C₆H₆ free of C₂H₄S.
